Suspicious Browser Extension

Learning and project connection

This activity allowed me to practise techniques of identifying extension metadata, identifying and recognising obfuscated strings and tracing data from key events to an HTTP request. The ExtAnalysis result was guided with an unknown author, two JavaScript files, two extracted urls and two domains. Manual string reconstruction showed an additional address not detected by the automatic URL extraction.

The take-home message for our smart-home monitoring and segmentation project is to test and validate automated results and to understand the constraints of passive monitoring. During this investigation into browser extensions, our project rules and false positive rate configuration were not Validated.
